

MediScan AI - Patient Medical Report

Patient: SNEKA

Report ID: 44

AI Summary Suggestion:

Of course.

DIAGNOSIS

Based on the report, the key findings are:

Mild Tortuosity of the Descending Aorta: This means the largest artery in your chest has a slight, gentle curve or twist to it.

Degenerative Changes in the Spine: This refers to normal, age-related "wear and tear" on the bones of your spine.

No Active Disease: The radiologist's main conclusion is that there are no signs of urgent or active medical problems like infection, tumors, or a collapsed lung.

2.

CAUSE

The mild tortuosity (curving) of the aorta is a very common finding, especially as people age. It can be associated with long-term high blood pressure (hypertension) or simply be a normal variant.

The degenerative changes in the spine are a natural part of the aging process, similar to developing arthritis in other joints.

3.

SUGGESTION

The overall impression of "no evidence of active disease" is very reassuring. However, you should schedule a follow-up appointment with the doctor who ordered this report. They will review these findings in the context of your overall health, medical history, and the reason the scan was ordered in the first place to determine if any further action is needed.
