

Patient: SNEKA

Report ID: 46

AI Summary Suggestion:

Of course. Diagnosis (What is the issue)

Based on the report, there are two main findings:

Degenerative Changes in the Spine: This is a common finding that refers to age-related "wear and tear" of the spinal bones and discs, similar to arthritis.

Mild Aortic Tortuosity: The aorta is the main artery carrying blood from your heart. "Mild tortuosity" means it has a slight, gentle curve or twist to it instead of being perfectly straight.

The most important conclusion of the report is in the "Impression" section: "No evidence of active disease." This is good news, as it means the radiologist did not see any signs of urgent or serious problems like a tumor, infection, or lung collapse.

2. Cause (Why it may have occurred)

Degenerative Changes: This is most commonly caused by the natural aging process. Over time, the cartilage and discs in the spine can wear down.

Aortic Tortuosity: This is also often related to aging and can be associated with long-term high blood pressure (hypertension), which can cause the artery to lengthen and curve over time.

3. Suggestion (Recommended action)

The most important next step is to schedule a follow-up appointment with your doctor to discuss these results.

Your doctor will interpret these findings in the context of your overall health, symptoms, and medical history to determine what, if any, action is needed. They will be able to tell you if these findings explain any symptoms you may be having and recommend the best course of action.
