

Patient: SNEKA

Report ID: 41

### **AI Summary Suggestion:**

Of course. Diagnosis (What is the issue)

The main conclusion of the report, listed under "Impression," is "No evidence of active disease." This is very good news and means the radiologist did not find any acute or serious issues like an infection, a collapsed lung, or a tumor.

The report does mention two other findings:

Degenerative changes in the spine: This refers to normal, age-related wear and tear on the bones and discs of your spine, similar to arthritis.

Mild tortuosity of the descending aorta: This means the largest artery in your chest has a slight, gentle curve or twist to it.

### **2. Cause (Why it may have occurred)**

Degenerative spine changes are a very common part of the natural aging process.

Mild tortuosity of the aorta is also a common finding, especially as people get older. It can sometimes be associated with long-term high blood pressure.

### **3. Suggestion (Recommended action)**

You should schedule a follow-up appointment with your doctor to discuss these results.

While the report shows no signs of active disease, your doctor can put these findings into the context of your overall health and explain what they mean for you specifically. They can also discuss managing any symptoms you may have (like back pain) and check your blood pressure.
