?Medical Image Report

There is mild tortuosity to the descending

Pneumothorax is seen. No discrete nodules

or adenopathy are noted. Degenerative

changes are present in the spine.

Impression: No evidence of active disease

Fact A AIT tags: Deformity of thoracic vertebrae

AI Summary Suggestion:

Of course. Based on my analysis of the provided medical report, here is a summary.

Please note: The report contains several typographical errors. The analysis below is based on the most likely intended medical terms.

Analysis of Medical Report

****1. Diagnosis (What is the issue):****

- * The main conclusion of the report is ****"No evidence of active disease,"**** which is very reassuring.
- * The report notes two specific findings:
 - * ****Mild Aortic Tortuosity:**** The aorta (the body's main artery) has a slight, gentle curve to it.
 - * ****Degenerative Spine Changes:**** There are signs of age-related "wear and tear" in the bones of the spine, similar to arthritis.
- * The report also specifically rules out other problems like a collapsed lung (pneumothorax), suspicious growths (nodules), or swollen lymph nodes (adenopathy).

****2. Cause (Why it may have occurred):****

- * Both the mild curving of the aorta and the degenerative changes in the spine are very common findings, especially as people get older. They are generally considered part of the ****natural aging process****.

****3. Suggestion (Recommended action):****

- * The findings are not alarming. However, you should ****schedule a follow-up appointment with the ordering physician**** to review these results. Your doctor can place these findings into the context of your overall health and the reason the scan was performed.
