

Patient: SNEKA

Report ID: 39

AI Summary Suggestion:

Of course. Diagnosis (What is the issue)

The main conclusion of the report is very positive: "No evidence of active disease."

The report does note a few findings, which are generally considered normal, especially with age:

Mild Tortuosity of the Descending Aorta: This means the largest artery in your body has a slight, gentle curve or twist to it. This is a common finding.

Degenerative Changes in the Spine: This refers to normal, age-related "wear and tear" in the bones of your spine, similar to arthritis.

No other issues were found: The report confirms there is no collapsed lung (pneumothorax), no masses, and no swollen lymph nodes (adenopathy).

2. Cause (Why it may have occurred)

The aortic tortuosity and degenerative spine changes are typically part of the natural aging process. Long-term high blood pressure can also contribute to the curving of the aorta.

3. Suggestion (Recommended action)

The most important step is to schedule a follow-up appointment to discuss these results with your doctor. While the report shows no signs of active disease, your doctor will interpret these findings in

the context of your overall health, symptoms, and the reason the imaging was ordered. They may also want to ensure your blood pressure is well-managed.
